

# Codility

Codility **simplifies recruitment of software engineers** by assessing programming skills over the Internet. Candidates are requested to code solutions to programming problems in a browser-based development environment. Submitted code is **automatically assessed** (for correctness and performance) and evaluation reports and ranking of candidates are presented to the recruiter.

Using Codility allows you to:

- interview only **a small number of quality candidates**
- **reduce cost** of the recruitment process **by up to 90%**
- compare **statistics** of your candidates against market averages

**IT recruiters** should think about Codility in terms of insurance policy, as ensuring the right quality of candidates presented to their clients will lower the rate of bad placements!

## Quick facts:

- works best as a **first line of screening**
- runs entirely **in a web browser**
- handles **10** programming languages - C++, C#, C, Java, Javascript (beta), Pascal, Perl (beta), PHP, Python, Ruby (beta)
- **3** difficulty levels of tasks
- **6000+** candidates tested already
- clients in **US, Europe** and **Asia**
- winner of **Seedcamp 2009** startup competition
